*The vibration method used in the vibeRx BS-110B machine is a pivotal movement similar to that of a teeter-totter. This is the most widely tested and safest vibration movement on the market today!

**Tri-planar is a combination of vertical, front-to-back, and side-to-side movement performed simultaneously. This movement entails 30 second to 1 minute bursts of vibration and requires exact positioning to avoid injury.

***Vertical is a simple up and down vibration. There is a concern among some researchers regarding long-term negative affects of spinal compaction using this method of vibration movement.
